

WHAT IS CLAIMED IS:

1. A cable support comprising:
 - a support means;
 - a cradle member movably mounted on said support means;
 - said cradle member provided with an open-ended channel carried on a frame; and
 - movable means disposed between said frame and said support means for allowing movement between said cradle member and said support means.
2. The cable support defined in Claim 1 wherein:
 - said movable means includes a spindle downwardly depending from said frame; and
 - said support means having a receptacle for insertably receiving said spindle for pivoting rotation of said cradle means with respect to said support means.
3. The cable support defined in Claim 2 wherein:
 - said support means includes a clamp for maintaining said support means in a stationary and fixed relationship with respect to said cradle member.

4. The cable support defined in Claim 3 wherein:

said cradle member channel is arcuate in side elevational view and is semi-circular in transverse cross section;

said cradle member further having opposite ends separated by said channel;

said frame includes a base extending between said opposite ends and located beneath said channel; and

a pair of spaced-apart posts supporting said channel on said base.

5. A device for supporting a line or cord to prevent chaffing, wear and fatigue comprising;

a two-component device wherein a first component is a cradle and a second component is a stationary support pivotal mounting said cradle;

said cradle having an arcuate channel with open opposite ends;

a frame disposed on said cradle midway between said opposite ends;

a pivot spindle downwardly depending from said frame; and

said stationary support having a receptacle insertably receiving said spindle whereby said cradle rotates with respect to said stationary support about a vertical longitudinal axis.

6. The device defined in Claim 5 wherein:

said stationary member includes a releasable clamp for securing said stationary member to a fixed stanchion.

7. The device defined in Claim 6 wherein:

said clamp comprises a yoke member and a closure member detachably connected to said yoke member;

said yoke member and said closure member include matable semi-circular cavities for engaging said stanchion.

8. The device defined in Claim 7 wherein:

said channel is elongated and adapted to receive and support a cord or line accommodating movement thereof to avoid chaffing, wear and fatigue on said cord or line.
